Subject: New York Radiation Sites - Proposed Estimates of Excavation Area

Good morning Eric,

Please find attached maps showing the estimated areas proposed for excavation at the Niagara Falls Boulevard and Holy Trinity sites. The estimates are based on data from the soil sampling analytical results of previous SAT and current RST 3 site assessments, which indicate radiological contamination of the proposed excavation areas. The volumes of contaminated soils proposed for removal from the Sites is based on worst case scenario excavation of the estimated areas to a depth of 2 feet below ground surface (bgs).

We are still making efforts to present you with a map that you can use to visually reference the proposed excavation areas of concern with the soil analytical results data. In addition, we are also preparing an estimated excavation area map for the Canadian Radium and Uranium site. You will continue to receive any pending radiological survey and analytical results data tables and figures for all three sites

Please let me know if you have any questions.

Thanks,

Ben Nwosu
